Importance: High

Hi Paula,

Could you please authorize this research for an amendment which is due?

Thanks, Jennifer

STIC:

Please search SEQ ID NO: 1 and 2 for Serial No. 10/650,123 in pending and commercial

databases.

Thanks,

Jennifer Graser

```
force...NMA0700, possible ribonuclease BN, len: 408 aa; similar to SW.RBN_ECOLI (EMBL:L19201), rbn, Escherichia coli ribonuclease BN (EC 3.1....), fasta acores; E(): 2.3e-28, 34.3% identity in 268 aa overlap Longer than rbn at the C-terminus. Also similar to TR:085449 (EMBL:AF067083) Vitreoscilla sp. hypothetical protein (376 aa), fasta scores; E(): 0, 45.0% identity in 33 aa overlap. Contains a region similar to NMA0677, fasta scores; E(): 44.0% identity in 45 aa overlap. Contains hydrophobic, possible membrane-spanning regions,
                                                                                                                                                                                                                                                                                                                                                                                  /producte "putative periplasmic protein"

invention relates to an isolated refolded Neisserial surface protein New refolded NspA protein, useful for preparing a composition for diagnosing, treating or preventing infection caused by Neisseria meningitidis or Neisseria gonorrheae. Disclosure; Fig 3; 62pp; English

A (Naph) from Neisseria meningitidis or Neisserial gonorthoeae. The invention also relates to the method of refolding an Nsph protein; an alkaline refolding buffer comprising ethanolamine and SB-12 (3-dimethyldodecylammoniopropanesulphonate) for refolding an Nsph protein; a pharmaceutical composition comprising the refolded Nsph protein; a pharmaceutical composition comprising the refolded Nsph protein; a carrier and optionally one or more other Neisserial antigens; a method of preventing or treating a Neisserial infection, an antibody immunospecific for the Nsph protein; and diagnosing a Neisserial infection. Nsph has characteristics which indicate that it is a potential vaccine candidate for the development of subunit vaccines for the treatment of infections caused by Neisseria meningitidis (meningococcus), which causes invasive bacterial diseases such as bacteraemia and meningitis, or Neisseria gonorrhoeae, the causative agent of gonorrhoea. Recombinantly produced proteins are tests and in drug screening. However, recombinantly produced proteins are tests and in drug screening. However, recombinantly produced proteins and yields may be very low due to mis-folding and aggregation of the protein. The method of the invention provides an improved method for refolding the protein.

Neph protein, and it is possible to increase the recovery of active and the form of the invention provides an improved method for refolding the protein. protein form partly purified inclusion bodies in amounts up to 100% without the need for further purification. The refolded Naph Proceen is useful for preparing a composition for diagnosing, treating or preventing infection caused by Neisseria meningitidis or Neisseria gonorrhoeae. The present sequence represents the NspA gene from Neisseria meningitidis

The present invention relates to a pharmaceutical composition comprising a liposome associated with an isolated polypeptide derived from Neisseria meningitidis strain 608b, where the polypeptide is the Neph protein. The composition is useful for inducing an immune response against N. meningitidis, for preventing and/or treating N. meningitidis infection and for treating and/or preventing neisserial infection chosen from N. meningitidis, N. genorrhoeae, N. lactamica and N. polysaccharea. It is useful for treatment or prophylaxis of meningities and meningoccaemia, in a host. The host is a mammal, preferably a human and more preferably an adult human. The present sequence is the Neisseria meningitidis strain GGGGCATCCGGCTTTTACGTCCAAGCCGATGCCGCACACGCAAAAGCCTCAAGCTTTTA 120 Composition comprising liposome associated with isolated polypeptide or polynucleotide derived from Neisseria meningitidis strain 608B, or its fragment or analog, useful for inducing an immune response against N. 1 Angabababacacrificcacacacrigatificccricicciccegecegecacacriged GGCGCATCCGGCTTTTACGTCCAAGCCGATGCCGCACACGCAAAAGCCTCAAGCTCTTTA 0; Gaps Length 525; Sequence 525 BP; 117 A; 186 C; 119 G; 103 T; 0 U; 0 Other; Indels 481 GTCCGTTCCGGCGAACTGTCCGTCGGCGTGCAATTCTGA 481 GTCCGTTCCGGCGAACTGTCCGTCGGCGTGCGCGTCAAATTCTGA ds; gene; NspA; vaccine; antibacterial; meningitis. 100.0%; Score 525; DB 12; 100.0%; Pred. A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39039 to AAT39042). The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Superantigen; ds; gene; SAq; staphylococcal enterotoxin; tumour; cancer; apoptosis; gene therapy; mammalian cell receptor; cytostatic; tumour associated lipid; anergy; T cell; antigen presenting cell; APC; tumouricidal immunocyte; antitumour.

Terman DS;

WPI; 2003-361759/34. P-PSDB; ABU79079 A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in T cells and antigen presenting cells.

Disclosure; Page; 167pp; English.

The invention relates to a mammalian cell receptor, useful in the treatment of cancer, which binds to tumour associated lipids and induces an energy or apoptosis in the T cells and antigen presenting cells (APCS). Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tumour associated lipids and induces cellular inactivation or death is deleted or functionally deactivated, producing (MI) a tumouricidal immunocyte population in vivo in a mammal ceptors for immunosupressive fatly acids, ceramides, divolipids, and producing (MI) a tumouricidal immunocyte population in vivo in a mammal ceptors for immunosupressive fatly acids, ceramides, divolipids, applicable in the creatment of cancer comprising a construct useful in the treatment of cancer comprising a cuperantisen (SAG) nucleoside inserted into a virus, a mammalian T cell useful in the treatment of cancer (Managolipids, apmalicables), comprising a lipid raft conjugated to a superantisen (SAG) nucleoside inserted into a virus in a mammal (By allowing tumour associated lipids to context immunocytes to the host), producing (MI) a tumouricidal immunocyte population ex vivo in a mammal (By allowing a tumour associated lipids are inactivated or deleted to produce a tumouricidally activated population ex vivo in a mammal (By allowing a tumour associated lipids are inactivated or deleted to produce a tumouricidally activated population ex vivo in a mammal (By allowing a tumour associated lipids to context APCs, in which receptors for the tumouricidal population ex vivo in a mammal (By allowing a tumour associated lipids to context APCs, in which adaptor producing a tumour associated lipids to context APCs, in which adaptor producing a tumour associated lipids to context T cells in which adaptor producing the tumouricidal population of T cells, and administering per tumouricidal population of T cells which administering the tumouricidal activated T cells ex vivo, in a mammal (By administering the tumouricidal population and proteins which inhibit T cell activation by tumour associated antigens are deleted or functionally deactivated) and producing (M7) a tumouricidal T cell population ex vivo in a mammal comprising allowing a fusion constructs with anti-tumour proteins or motifs. The present sequence encodes an anti-tumour protein which is co-administered with or incorporated into a fusion construct with a superantigen. Note: The sequence data for this patent incorporate to the printed specification, but was obtained in electronic format from the US patnet office website at "seqdata.uspto.gov/sequence.html?DocID=20020177551" superantigen-lipid raft conjugate to contact immunocytes in vivo. The receptors, methods and compositions are useful for treating cancers and tumours. Bacterial superantigens are co-administered or administered as tumour associated antigen to contact immunocytes in which adaptor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  480
                                                                                                                                                                  The invention describes a receptor in a mammalian cell that inhibits regular activation by receptors specific for lipid-based tumour associated antigen. The receptor has cytostatic and antimicrobial properties and is suitable for use in gene therapy. The receptors, methods and compositions are useful for treating a neoplastic disease or tumour (cancer), and infectious diseases. This sequence encodes Neisseria meningitidis lipopolysaccharide (LPS) to which tumour cells develop

The present invention describes the full length genome of Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613 cepresent fragments of the NMB genomic sequence, as the sequence was too long to go in a record on its own it was split into 8 sequences which coverlap each other at the beginning and end of each sequence by 49980 bp (1.e. the last 49980 bp of AAF21507 are repeated at the beginning of AAF21607, the last 49980 bp of AAF21607 are repeated at the beginning of AAF21609, and so on). AAF21545 to AAF21589 to AAF21606 represent portains priven in AABS8550 to AABS8593, and AAF21589 to AAF2160 frepresent portains primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. Neisserial nucleic acids, proteins and/or antibodies which binds to the proteins can be used in compositions for treating or preventing infection due to Neisserial bacteria or as diagnostic reagent for detecting the presence of Neisserial bacteria or of antibodies raised to Neisserial bacteria computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the computer membrane proteins currently used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         90487

The present invention relates to a new gram-negative bacterial bleb presenting on its surface the PorB outer membrane protein from Chlamydia trachomatis, or a protective antigen from C. pneumoniae. The invention is useful for preventing C. trachomatis or C. pneumoniae infection in a host. The present nucleic acid sequence represents a Neisseria gonorrhoeae gene as described in the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39039 to AAT39042). The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)

```
A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39039 to AAT39042). The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or thair fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GTCGATTTGGATGCCGGCTACCACTACAACTACGGCAAAGTCAACACTGTCAAAAAC 480

The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABZ37706-ABZ42016 represent nucleic acid molecules of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39039 to AAT39042). The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)

The Invention relates to an insolated relocated with serial suitable process. The invention relates to the method of refolding an NspA protein; an alkaline refolding buffer comprising ethanolamine and SB-12 (3-dimethyldodecylammoniopropaneaulphonate) for refolding an NspA protein; and dimethyldodecylammoniopropaneaulphonate) for refolding an NspA protein, a carrier and optionally one or more other Neisserial antigens; a method of preventing or treating a Neisserial infection. NspA has conferential composition comprising a Neisserial infection. NspA has conferential or treating a Neisserial infection. NspA has consed by Neisseria meningitidis (meningococcus), which causes invasive for the development of subunit vaccines for the treatment of infections cansed by Neisserial meningitidis (meningococcus), which causes invasive consed by Neisserial diseases such as bacteraemia and meningitis, or Neisserial councinged by Neisserial diseases such as bacteraemia and meningitics or Neisserial diseases such as bacteraemia and meningitics or Neisserial could therefore be used to produce vaccine compositions and it could also be used in the development of new antimicrobial agents, diagnostic tests and in drug screening. However, recombinantly produced proteins are frequently unable to adopt their biologically active conformations, and conformation provides an improved method for refolding the NspA protein, and it is possible to increase the recovery of active NspA protein, and it is possible to increase the recovery of active without the need for further purification. The refolded NspA protein is useful for preparing a composition for diagnosing, treating or preventing treating or preventing infection caused by Neisseria meningitidis or Neisseria gonorance warrance was a second method for refolding the warrance warrance warrance warrance 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABZ37706-ABZ42016 represent nucleic acid molecules of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TATTTCGGCGCGCGTTGAGCCTCAACCGCGTTCCGCCCACTTGGGCGGCAGCGACAGC
